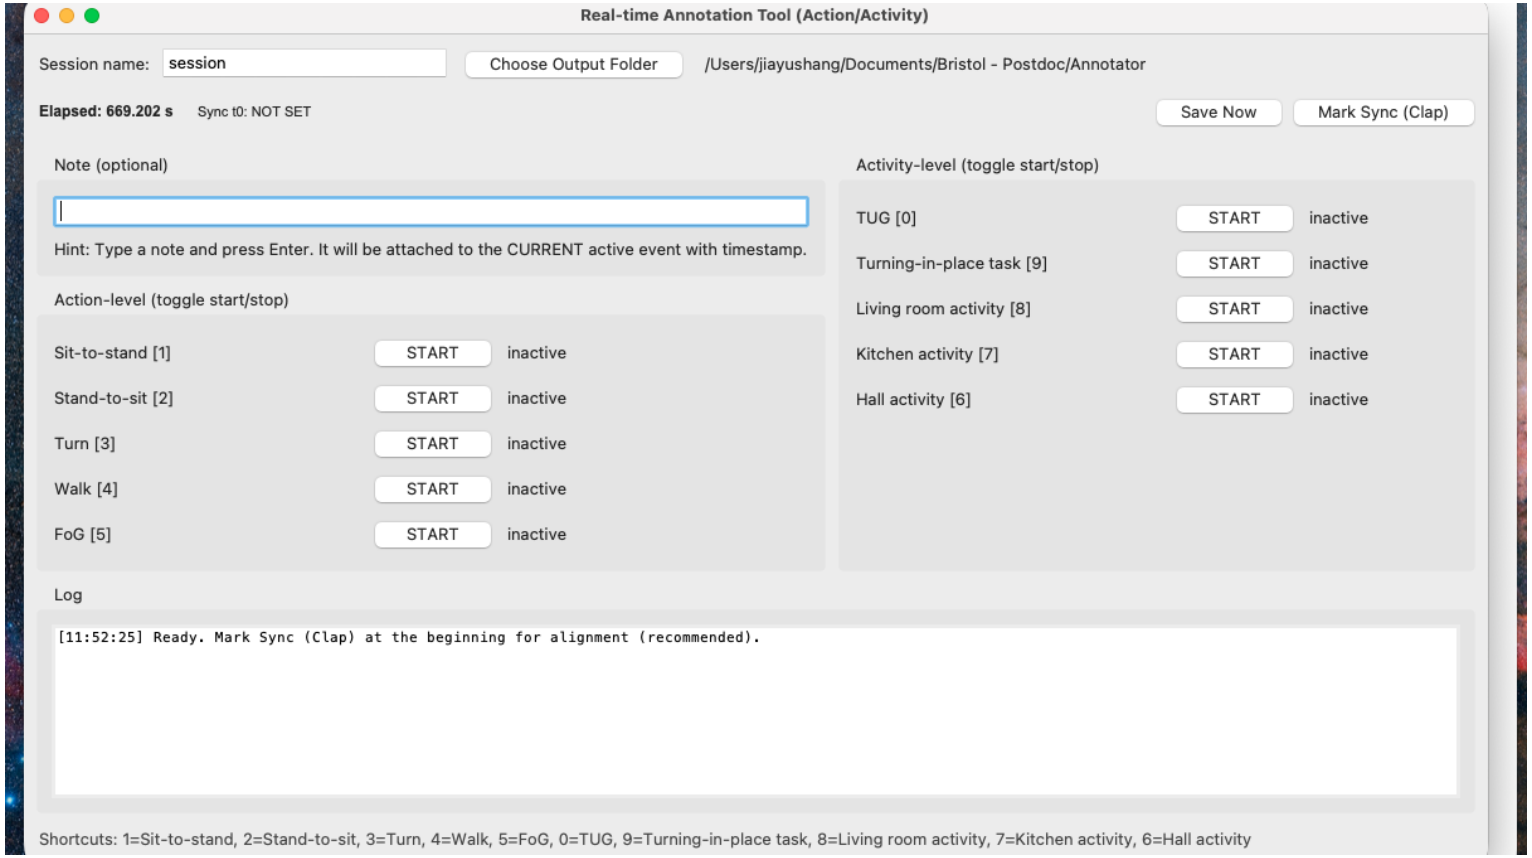
WP3

Jiayu, Telmo

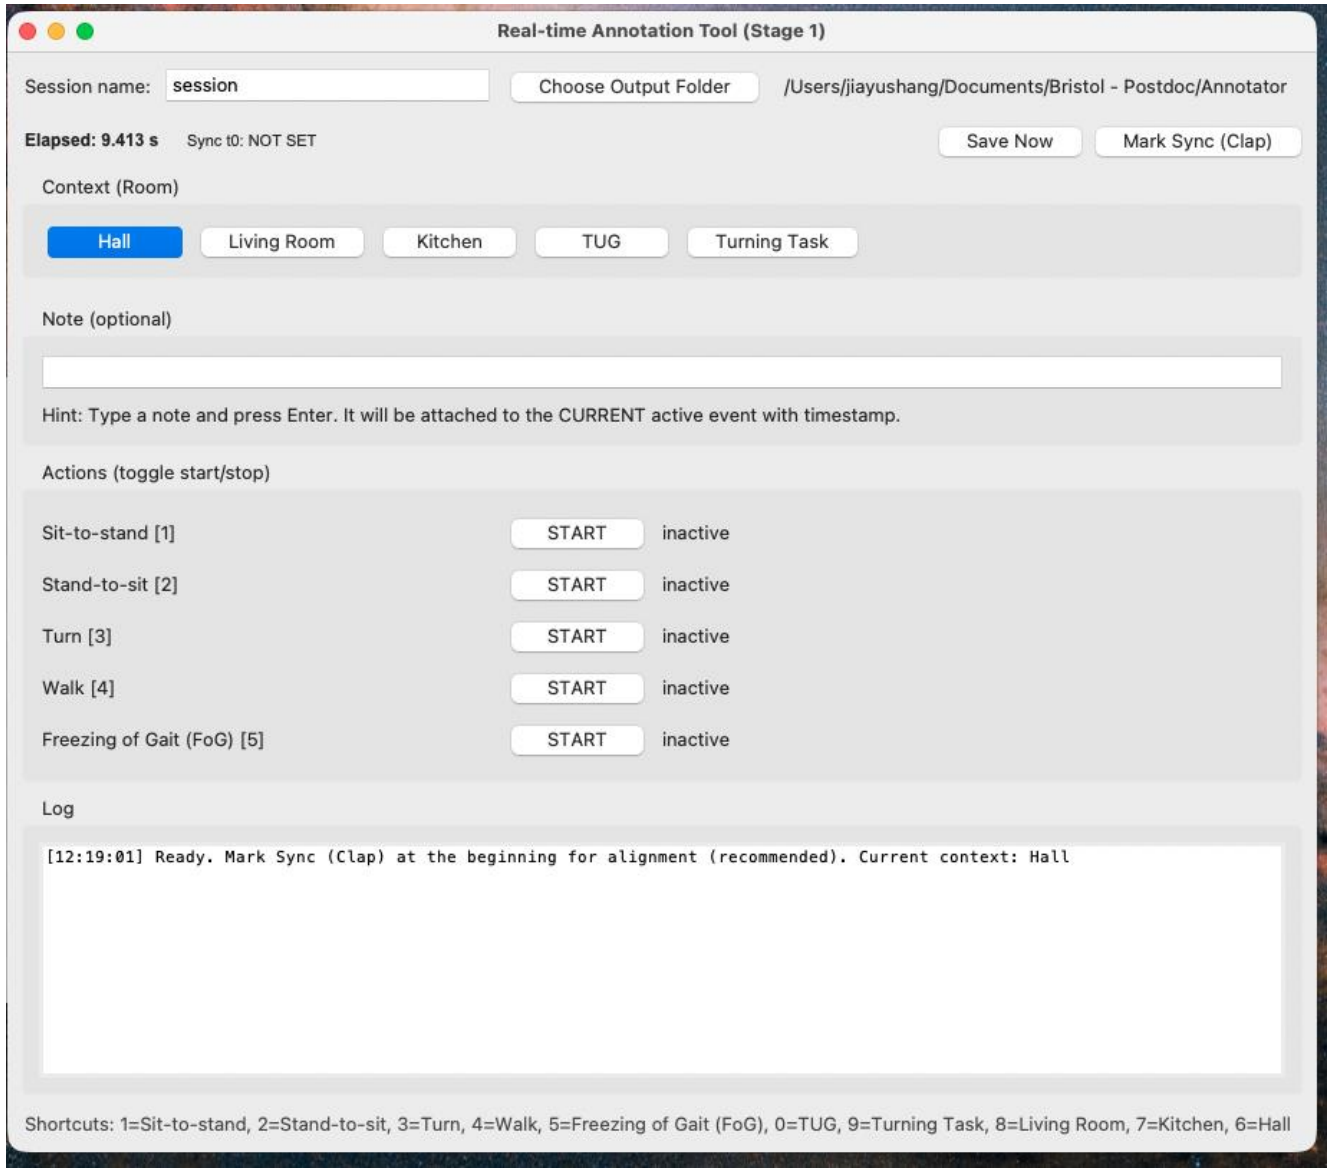
Before

- We found that when annotating in a sphere house, when attention needs to switch between actions and activities on the left and right sides of the panel, it is easy to forget the action that has already started and forget to stop.



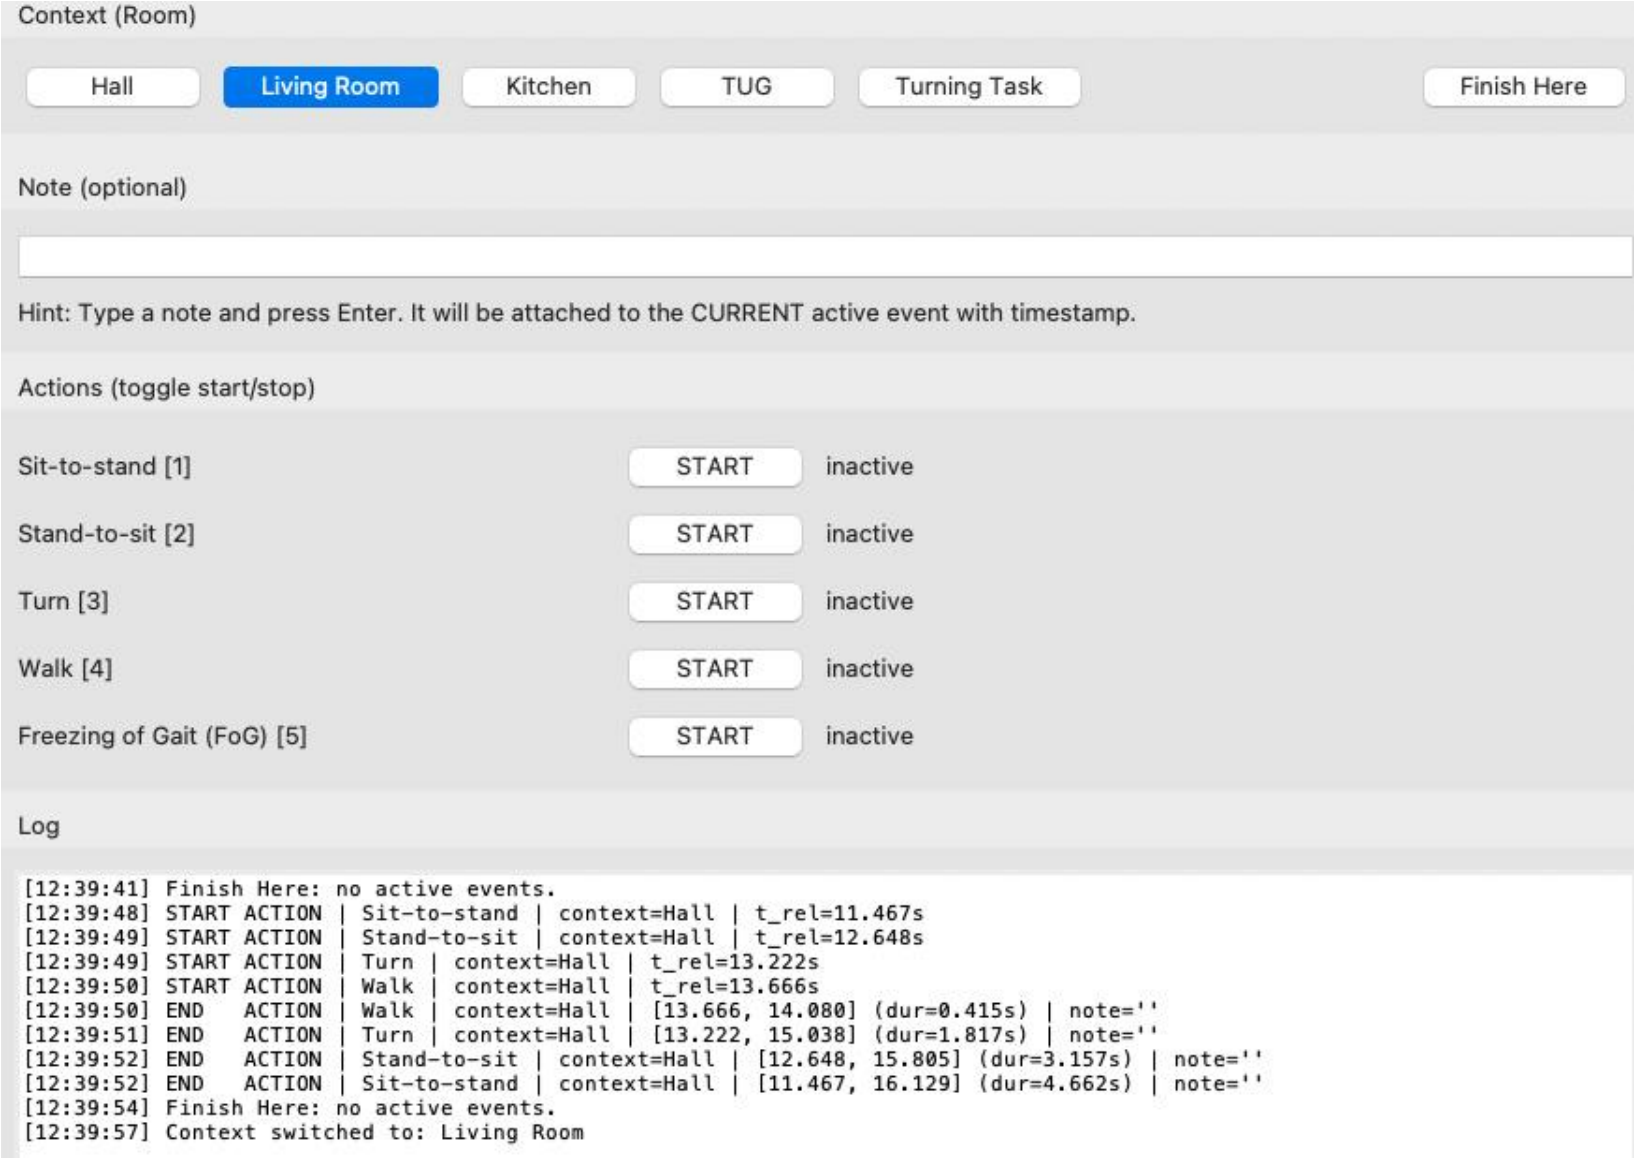
After

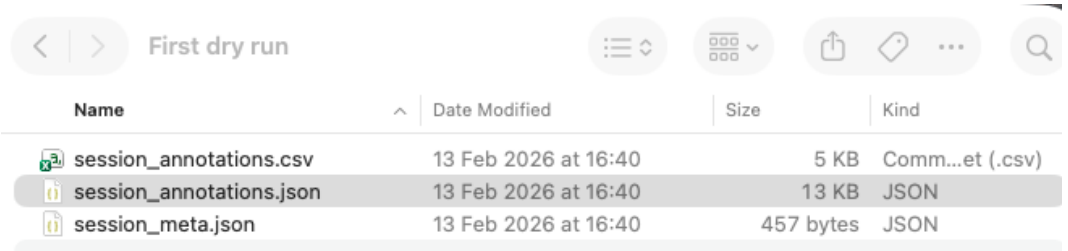
- In addition, if we list all the activities as we discussed in the last meeting, the interface might become very large and ugly if we add more activities in the future.
- So I removed all the activities and set up Room for context, so that the room buttons are clicked when the action takes place in a particular room.
- Actions (TUG) that appear only once can be added after "room".



After 2

- Another issue is that when collecting data, if you need to switch rooms after completing a series of actions in one room, you may need to pause the process.
- Previously, we didn't have a pause button, so the time was recorded continuously. Now that we have one, we can provide an approximate time for room context.
- In the next phase, we can directly drag and drop this timeline on the timeframe, which will also help us ignore the rotation of irrelevant people or other signals.

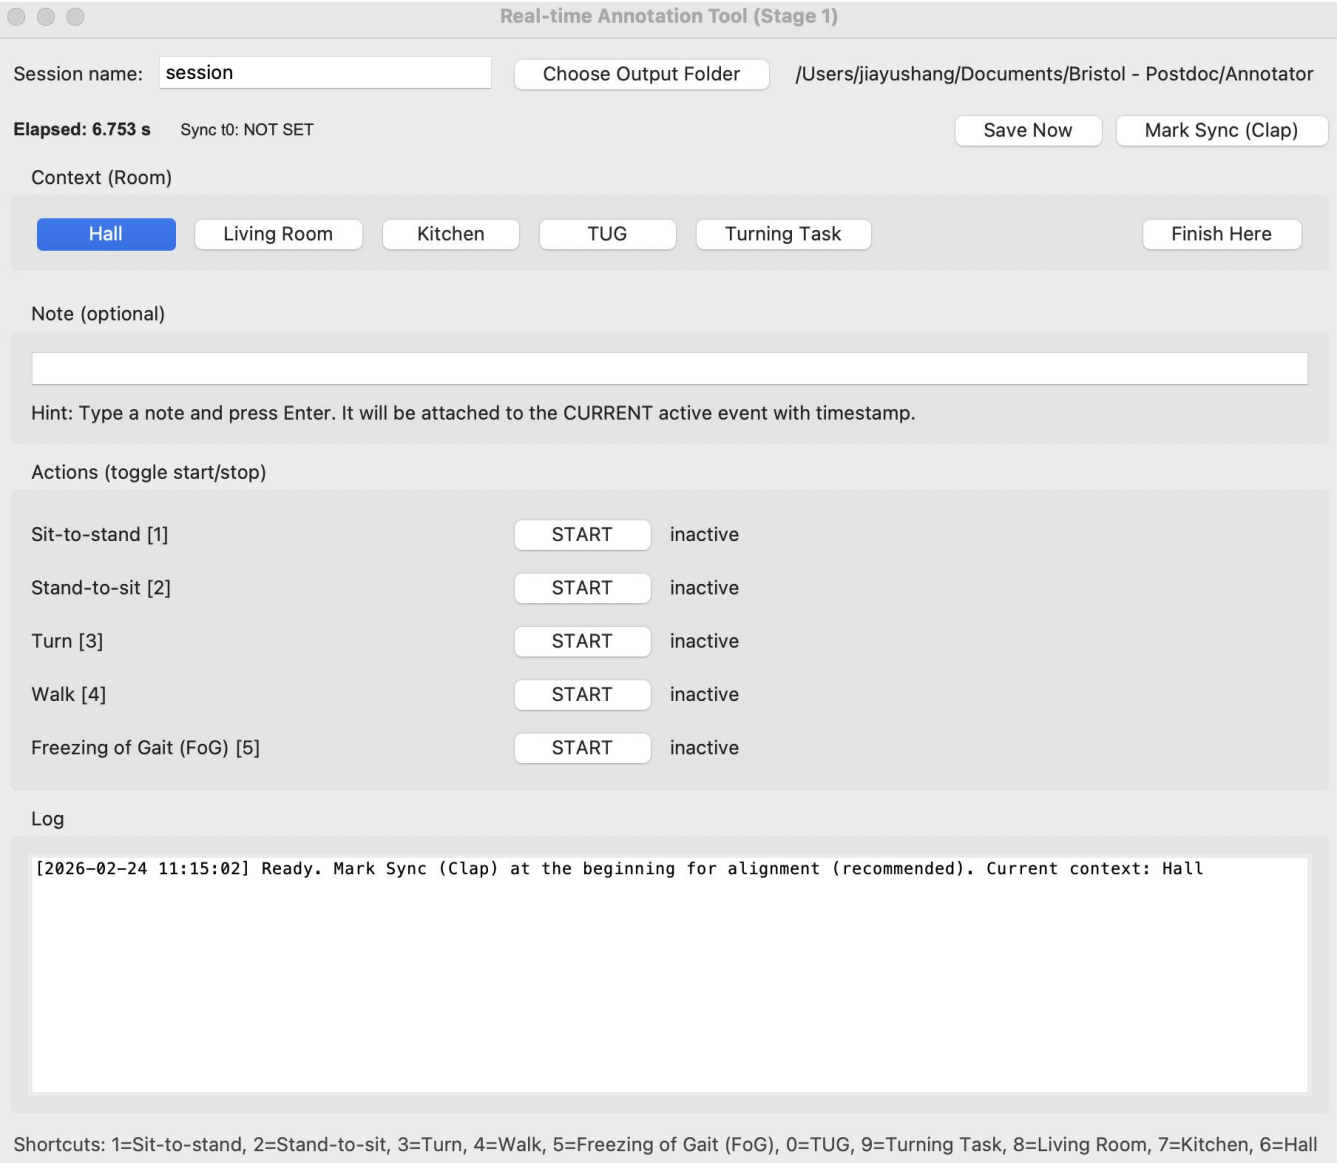




After 3

- Log not save
- The log is actually quite valuable; it records the following, which you can view beforehand:
- Each START/END operation (including timestamps)
- Additional notes on the process
- Room switching records

  (Finish Buttons)
- SYNC marker time
- Save operation itself
- Date and year provided



Files saved

- **absolute Unix time (epoch time)**
- **Relative time**
- **Datetime**
